CHAPTER 1 OVERVIEW

1. Introduction to the chapter

Thank you for choosing the OLinuXino single board computer from Olimex! This document provides a user’s guide for the Olimex OLinuXino board. As an overview, this chapter gives the scope of this document and lists the board’s features. The differences between the members of the OLinuXino family are mentioned. The document’s organization is then detailed.

The OLinuXino development board enables code development of applications running on the microcontroller i.MX233, manufactured by Freescale Semiconductor.

OLInuXino is an open-source, open-hardware project and all documentation is available to the customer.

1.1 Features

• iMX233 ARM926J processor at 454Mhz
• 64 MB RAM
• SD-card connector for booting the Linux image
• TV PAL/NTSC video output
• 3 USB High Speed Hosts
• Stereo Audio Input
• Stereo Headphones Audio Output
• Two Buttons
• UEXT connector for connection of different peripheral modules
• 40 pin GPIO for connection to external hardware
• Board is in the proper shape and dimensions to fit inside Pactec JM42 plastic box [http://www.pactecenclosures.com/pdfs/drw_JM-42.pdf](http://www.pactecenclosures.com/pdfs/drw_JM-42.pdf)
• Power supply input 6-16VDC
• optional WIFI RTL8188CU module
• PCB dimensions: 3.70” x 2.15” (94.0mm x 54.6mm)
• Nominal dimensions: 3.70” x 2.65” (94.0mm x 67.3mm)

* 100Mbit Ethernet for the wired network of OLinuXino-MAXI. 150Mbit for the WIFI following 811.02n standard.

** All three boards have the option to work with MOD-WIFI_RTL8188, which is USB WIFI modem with RTL8188CU chip and can be purchased separately. MOD-WIFI_RTL8188 can be connected to any of the OLinuXino boards via the USB.

*** OLinuXino-MINI has additional option of having RTL8188CU hardware mounted! If you wish RTL8188CU embedded in the device you should purchase OLinuXino-MINI-WIFI. Choosing the embedded WIFI option will leave your USB-HOSTs available for use.
1.3 Target market and purpose of the board

The boards from the OLinuXino family are ready to use, easy to setup and are suitable for embedded programming enthusiasts, Linux hobbyists, gadget fans and also professionals (since its low cost makes it very good solution for application orientated embedded systems). The main usage of the board is software embedded development without the urge of understanding perfectly the hardware.

The strong points of the boards are the processor speed, the mobility of the board and the low price. The very well documented Freescale iMX233 is another solid feature.

Customers have full access to the technical documentation of the board. The software is released under General Purpose License and the board is considered open-hardware.

1.4 Organization

Each section in this document covers a separate topic, organized as follow:

– Chapter 1 is an overview of the board usage and features
– Chapter 2 provides a guide for quickly setting up the board
– Chapter 3 contains the general board diagram and layout
– Chapter 4 describes the component that is the heart of the board: the iMX233 microcontroller
– Chapter 5 is an explanation of the control circuitry associated with the microcontroller to reset. Also shows the clocks on the board
– Chapter 6 covers the connector pinout, peripherals and jumper description
– Chapter 7 shows the memory map
– Chapter 8 provides the schematics
– Chapter 9 contains the revision history, useful links and support information
CHAPTER 2  SETTING UP THE OLinuXino BOARD

2. Introduction to the chapter

This section helps you set up the OLinuXino development board for the first time. Please consider first the electrostatic warning to avoid damaging the board, then discover the hardware and software required to operate the board.

The procedure to power up the board is given, and a description of the default board behavior is detailed.

2.1 Electrostatic warning

OLinuXino is shipped in a protective anti-static package. The board must not be exposed to high electrostatic potentials. A grounding strap or similar protective device should be worn when handling the board. Avoid touching the component pins or any other metallic element.

2.2 Requirements

In order to set up the OLinuXino optimally, the following items are required:

- 6V to 16V source of power with 1A maximum amperage.
- SJTAG interface programmer
- USB keyboard
- Monitor with composite interface or Personal Computer + USB-SERIAL-CABLE-F
- SD card with Linux image

Note that the board arrives without SD card or Linux image. You can purchase a card with Linux separately. It is recommended that the user has basic Linux experience.

Some of the suggested items can be purchased by Olimex, for instance:

iMX233-OLinuXino-SD – SD card with the Linux image
USB-SERIAL-CABLE-F – USB serial console cable female (check “6.1.1 UART Debug” for info how to connect it to the board)
SY0612E – power supply adapter 12V/0.5A for iMX233-OLinuXino-MINI
2.3 Powering the board

The board is powered either via the PWR jack or via a battery. It should be supplied from a 6V to 16V source with maximum current of 1A from the power jack.

All measures below are taken at 10V.

If measuring the current consumption it should be around 0.06A before initializing all the peripherals. The consumption raises to 0.12A without WIFI and USB hosts initialized and Linux running. The consumption goes up 0.15A with the Linux running when WIFI and both USB hosts initialized.

If you have a standard USB flash drive attached to a USB host, Linux and WIFI running the typical consumption is around 0.20A.

When powered by the typical 3.7V battery the WIFI and USB-hosts will be disabled if you use external 3.3 DC-DC (not mounted by default).

For the European customers we sell a power supply adapter 12V/0.5A – SY0612E.

2.4 Prebuilt software

Note that the boards arrive without Linux or SD card. The Linux image can be purchased separately on a SD card or you can build and write it yourself.

When we program the boards we change the default position of the following HW_OCOTP_ROM0 fuses of the processor:

SD_MBR_BOOT(3) - Blown
SD_POWER_GATE_GPIO(21:20) – 10-PWM3

For burning the fuse position we use the BitBurner software. This operation is discussed in details before. Proceed with great caution when burning fuses since it is irreversible operation.
2.5 Using BitBurner

IMPORTANT! MODIFYING THE FUSES IS IRREVERSIBLE PROCESS! BURNING THE WRONG FUSES MIGHT DAMAGE OLINUXINO IRREVERSIBLY! BURNING WRONG FUSES MIGHT CAUSE BOOT PROBLEMS!

BURN FUSES AT OWN RISK!

The bit burning is done via the USB of the computer connected to the OLINUXINO board and the BitBurner software. To be able to burn the fuses you will need to make a custom cable that connects a USB with the 3 pin holes found at the bottom of the board named “GND”, “DP”, “DM” (check the picture below for a better view how the three wires must be connected.

After soldering the three wires you can place a marker on each of them or use colored wires to be able to distinguish them. You can also use some gel to keep them tight on the USB connector. On the opposite side of the cables you might place 50mil (1.27mm) male connector following the order of the signals. Please also restrain from using wires longer than 20 cm since that might make the connection unreliable.

Download BitBurner from [https://www.olimex.com/dev/OLINUXINO/iMX233-OLINUXINO/BitBurner.v1.0.4.6.zip](https://www.olimex.com/dev/OLINUXINO/iMX233-OLINUXINO/BitBurner.v1.0.4.6.zip). Extract it and start the .exe. If you connect everything you should see and choose HID-compilant device from the “Select device” drop-down menu. If you check the fuses we have already burned the application should show an image as the one on the next page.
2.6 Building the Linux image

Note that building the Linux image from scratch is a time-consuming task. Even with powerful machine and fast internet connection it might take few hours compiling. Some Linux distributions might lack the tools required to compile/build/execute scripts/download from repository – how to get those is not discussed below.

The Linux image is created and downloaded from https://github.com/Freescale/fsl-community-bsp-platform. For the test here we used Debian 6.0 with GNOME visual libraries. The steps we did:

1) From the terminal created folder “bin” in home folder:

   user@dist$: mkdir bin
   user@dist$: cd bin

Add bin directory to PATH in order to do the next steps easier. Else navigate to the right folders.

2) Installed `repo` utility needed for the bitbake file fetching from the repository:

   user@dist$: curl https://dl-ssl.google.com/dl/googlesource/git-repo/repo > ~/bin/repo
   user@dist$: chmod a+x ~/bin/repo
3) Created directory for the project and download the BSP source from the git repository:

```bash
user@dist$: mkdir fsl-community-bsp
user@dist$: cd fsl-community-bsp

~/fsl-community-bsp$: repo sync
```

4) You can change the settings for the build if you want at fsl-community-bsp/build/conf/local.conf. I changed the “machine” name to “imx233-olinuxino-maxi”.

For Linux kernel configurations and settings you can do (of course you can use also the default settings):

```bash
~/fsl-community-bsp$: ./setup-environment build
~/fsl-community-bsp/build$: bitbake linux-imx -c menuconfig
```

Check the image below:

![Linux Kernel Configuration](image)

5) Now to start building the image:

```bash
~/fsl-community-bsp$: ./setup-environment build
~/fsl-community-bsp/build$: bitbake core-image-minimal
```

Note: on different Linux distributions you might have different tools installed and you will probably
need to install dependencies needed for the compile/build scripts. Here are some (but not all) of the mandatory ones: G++; diffstat; texi2html; chrpath; gawk; texinfo; some git client.

To ensure you have the latest version supported with all the updates visit https://github.com/OLIMEX/OLINUXINO and https://github.com/Freescale/fsl-community-bsp-platform.

2.7 How to blink the LED

In this chapter you will find a way to achieve the most basic task in electronics – the “Hello World” of electronics – blinking the LED.

First we set the pin responsible for the LED as an output and we can set its value manually to high or low position – make it blink manually. The LED mounted on the board uses GPIO65. You can use external diode instead of the one mounted – you have to look at the table “The Linux implementation of pins” in the hardware section to get the correct linux name for the GPIO pin.

```
echo out > /sys/class/gpio/gpio65/direction
echo 1 > /sys/class/gpio/gpio65/value
```

If you want to set the blink off you should change the value on the second line to:

```
echo 0 > /sys/class/gpio/gpio65/value
```

To show the info for all GPIOs:

```
ls /sys/class/gpio
```

To make it turn on – turn off automatically (e.g. blink) we use the text redactor VI to write the Linux script:

```
echo out > /sys/class/gpio/gpio65/direction
while true
do
  echo 1 > /sys/class/gpio/gpio65/value
  sleep 1
  echo 0 > /sys/class/gpio/gpio65/value
  sleep 1
done
```

We save it as as “gpio” and we make it executable with

```
chmod +x gpio
```
then we execut the script with:
The LED should start blinking with 0.5Hz.

2.8 How setup the I2C, SPI, UART

There are number of examples with our extension module board to achieve those connections on the UEXT. The examples might be used as an example for I2C, SPI or UART communication. You can find them at our GitHub page:
https://github.com/OLIMEX/OLINUXINO/tree/master/SOFTWARE/iMX233

2.9 First steps with iMX233-OLinuXino-MINI

CHAPTER 3 OLINUXINO BOARD DESCRIPTION

3. Introduction to the chapter
Here you get acquainted with the main parts of the board. Note the names used on the board differ from the names used to describe them. For the actual names check the OLinuXino board itself.

3.1 Layout (top view)
CHAPTER 4 THE iMX233 MICROCONTROLLER

4. Introduction to the chapter

In this chapter is located the information about the heart of OL.inuXino – its microcontroller. The information is a modified version of the datasheet provided by its manufacturers.

4.1 The microcontroller

- ARM926 CPU Running at 454 MHz
- Integrated ARM926EJ-S CP
- 16-Kbyte data cache and 16-Kbyte instruction cache
  - One-wire JTAG interface
  - Resistor-less boot mode selection using integrated OTP values
- 32Kbytes of Integrated Low-Power On-Chip RAM
- 64 Kbytes of Integrated Mask-Programmable On-Chip ROM
- 1 Kbit of On-Chip One-Time-Programmable (OCOTP) ROM
- Universal Serial Bus (USB) High-Speed (Up to 480 Mb/s), Full-Speed (Up to 12 Mb/s)
  - Full-speed/high-speed USB device and host functions
  - Fully integrated full-speed/high-speed Physical Layer Protocol (PHY)
  - Mass storage host-capable (uncertified by USB-IF)
- Power Management Unit
  - Single inductor DC-DC switched converter with multi-channel output supporting Li-Ion batteries.
  - Features multi-channel outputs for VDDIO (3.3 V), VDDD (1.2 V), VDDA (1.8 V), VDDM (2.5V) and regulated 4.2V source.
  - Direct power from 5-V source (USB, wall power, or other source), with programmable current limits for load and battery charge circuits.
  - Silicon speed and temperature sensors enable adaptive power management over temperature and silicon process.
- Audio Codec
  - Stereo headphone DAC with 99 dB SNR
  - Stereo ADC with 85 dB SNR
  - Stereo headphone amplifier with short-circuit protection and direct drive to eliminate bulky capacitors
  - Amplifiers are designed for click/pop free operation.
  - Two stereo line inputs
  - Microphone input
  - SPDIF digital out
- 16-Channel Low-Resolution ADC
— 6 independent channels and 10 dedicated channels
— Resistive touchscreen controller
— Temperature sensor controller
— Absolute accuracy of 1.3%

■ Security Features
— Read-only unique ID for digital rights management algorithms
— Secure boot using 128-bit AES hardware decryption
— SHA-1 hashing hardware
— Customer-programmed (OTP) 128 bit AES key is never visible to software.

■ External Memory Interface (EMI)
— Provides memory-mapped (load/store) access to external memories
— Supports the following types DRAM:
  — 1.8V Mobile DDR
  — Standard 2.5V DDR1

■ Wide Assortment of External Media Interfaces
— High-speed MMC, secure digital (SD)
— Hardware Reed-Solomon Error Correction Code (ECC) engine offers industry-leading protection and performance for NANDs.
— Hardware BCH ECC engine allowing for up to 20-bit correction and programmable redundant area.

■ Dual Peripheral Bus Bridges with 18 DMA Channels
— Multiple peripheral clock domains save power while optimizing performance.
— Direct Memory Access (DMA) with sophisticated linked DMA command architecture saves power and off-loads the CPU.

■ Highly Flexible Display Controller
— 8-bit data ITU-R BT.656 D1 digital video stream output mode (PAL/NTSC), with on-the-fly RGB to YCbCr color-space-conversion.
— Flexible input formats

■ Pixel Processing Pipeline (PXP)
— Provides full path from color-space conversion, scaling, alpha-blending to rotation without intermediate memory access
— Bi-linear scaling algorithm with cropping and letterboxing
— Alpha-blend, BITBLT, color-keying
— Memory efficient block-based rotation engine

■ Integrated TV-Out Support
— Integrated PAL/NTSC TV-encoder fully pipelined to display controller’s D1 resolution output stream
— Integrated low-power 10-bit Video DAC (VDAC) for composite analog video output.

■ Data Co-Processor (DCP)
— AES 128-bit encryption/decryption
— SHA-1 hashing
— High-speed memory copy

■ Three Universal Asynchronous Receiver-Transmitters (UARTs)
  — Two high-speed application UARTs operating up to 3.25 Mb/s with hardware flow control and dual DMA.
  — Debug UART operates at up to 115Kb/s using programmed I/O.

■ I2C Master/Slave
  — DMA control of an entire EEPROM or other device read/write transaction without CPU intervention

■ Dual Synchronous Serial Ports (for SPI, MMC, SDIO, Triflash)
  — 1-bit, 4-bit and 8-bit MMC/SD/SDIO modes
  — Compliant with SDIO Rev. 2.0
  — SPI with single, dual and quad modes.

■ Four-Channel 16-Bit Timer with Rotary Decoder

■ Five-Channel Pulse Width Modulator (PWM)

■ Real-Time Clock
  — Alarm clock can turn the system on.
  — Uses the existing 24-MHz XTAL for low cost or optional low power crystal (32.768 kHz or 32.0 kHz), customer-selectable via OTP.

■ Customer-Programmable One-Time-Programmable (OTP) ROM via Integrated eFuse Block
  — Resistor-less boot mode selection
  — 128-bit boot mode crypto key
  — Boot mode specification of NAND characteristics for device that the customer is soldering to the board. This means no more costly delays waiting for new device support in the boot ROM.
  — Fully software-programmable and accessible

■ Flexible I/O Pins
  — All digital pins have drive-strength controls
  — Most non-EMI digital pins have general-purpose input/output (GPIO) mode.

For comprehensive information on the microcontroller visit the Freescale’s web page for a datasheet.
CHAPTER 5 CONTROL CIRCUITY AND HARDWARE MODULES

5. Introduction to the chapter

Here you can find information about reset circuit and quartz crystals locations, the power supply circuit is discussed.

5.1 Reset

OLinuXino's reset circuit includes R42 (47KΩ), R10 (47 Ω), T1, T2, Q1 and a RESET button. The RESET is specific for the fact that it is accomplished when the quartz is disconnected using 3.3V and the transistors T1 and T2.

5.2 Clocks

24 MHz quartz crystal Q1 is connected to pins 121 and 122 of the iMX233 processor.

12 MHz quartz crystal Q2 is found at pins 6 and 7 of the LAN and WIFI controller – GL850G.
5.3 Power supply circuit

The power supply circuit of OLinuXino-MINI allows flexible input supply from 6V to 16V direct current. This means a wide range of power supplies, adapters, converters are applicable. The maximum amperage the board can draw is 1A.

The board with the prebuilt software and SD card equipped consumes between 0.12A and 0.16A while booting the Linux image. When no other peripherals are connected the board (except the SD card) the typical consumption is 0.12A. With one flash memory stick the consumption raises to 0.16A.

When powered by the typical 3.7V battery the USB-hosts are disabled. The consumption when Linux is running is around 0.75A.

The board can be powered either from the power jack or from the LIPO_BAT connector. Note that since standard batteries can't provide the voltage needed for the board it is advisable to use the power from the power jack. When you use the LIPO_BAT connector and a battery the chip handling the Ethernet and the USB hosts is disabled. Also the power button has alternative function when the board is powered by a battery – check 6.12.

If you have successfully powered the board the red PWR LED will turn on. Note that it is possible to have the PWR LED on even if there isn't enough power for proper operation of the board and all the peripherals currently connected.

Note that the whole 3.3V part is not mounted (elements marked as NA) by default because we use the internal 3.3V DC-DC convertor in the iMX233. However, the internal DC-DC in the processor
is not very reliable when a lot of current is required. It is better to mount the elements of the 3.3V part circuit if you wish to use 3.3V at heavier loads.
CHAPTER 6 CONNECTORS AND PINOUT

6. Introduction to the chapter

In this chapter are presented the connectors that can be found on the board all together with their pinout and notes about them. Jumpers functions are described. Notes and info on specific peripherals are presented. Notes regarding the interfaces are given.

6.1 Debugging interfaces

If you don't have a separate monitor or display around, and you don't wish to swap cables constantly with your personal computer using the debug interfaces provide better option for you OLinuXino experience.

There are three debugging options available on the OLinuXino. It is preferable to use one of the first two – UART or SJTAG but in case you want to use the classic 6-wire parallel JTAG there is an option explained below.
### 6.1.1 UART debug

The first one is a debug UART interface – U_DEBUG. You can use our USB-SERIAL-CABLE for debugging via the UART.

**Note on how to use the U_DEBUG with USB-SERIAL-CABLE-F which has RED GREEN BLUE wires GND=BLUE, RX(INPUT)=GREEN, TX(OUTPUT)=RED. You have to connect to OLinuXino-MAXI U_DEBUG connector in this sequence:**

- BLUE wire to pin.3 (GND)
- GREEN wire to pin.2 (TX)
- RED wire to pin.1 (RX)

The baud rate for serial communication is 115 200.

<table>

</tr>
<tr>
<td>4</td>
<td>4</td>
<td>DEBUG</td>
<td>84</td>
</tr>
</tbody>
</table>

You can also check the pin names at the bottom of the board under the U_DEBUG header.

### 6.1.2 SJTAG debug

The second interface is the Serial JTAG (SJTAG) one-wire interface. It works with various external JTAG debugger dongles through a Freescale-defined FPGA/CPLD. SJTAG supports the Green Hills Slingshot and ETM probe debugger dongles, as well as those made by ARM, Abatron, and Lauterbach.

The pin names are also written at the bottom of the board for your convenience. Note that the SJTAG interface comes without plastic header mounted.

The HW_DIGCTL_CTRL_USE_SERIAL_JTAG bit in the digital control block selects whether the
one-wire serial JTAG interface or the alternative six-wire parallel JTAG interface is used. There are other options in the digital control block which might interest you and our advice is to check the iMX233’s datasheet released by Freescale.

### 6.1.3 Classic JTAG debug

The third option is to use the classic 6-pin parallel JTAG (not including GND and VCC). There are pads left for this option at the bottom of the board under the SD card holder. They are named individually and framed near a “JTAG” name.

The important thing is that these pins are multiplexed with the SD card signals. In order to use the 6-pin JTAG you will have to stop using the SD card. Note also that the classic JTAG interface comes without plastic header mounted so in order to use it you will need to use wires for connection.

Consider the software settings required to switch from SJTAG to 6-pin JTAG and vice verse referring to the iMX233 manual. For instance:

The HW_DIGCTL_CTRL_USE_SERIAL_JTAG bit in the digital control block selects whether the serial JTAG interface or the alternative six-wire parallel JTAG interface is used.

\[
\text{HW\_DIGCTL\_CTRL\_USE\_SERIAL\_JTAG} - 0\times0 - \text{Selects whether the one-wire serial JTAG interface or the alternative six-wire parallel JTAG interface is used.} \\
\text{HW\_DIGCTL\_CTRL\_USE\_SERIAL\_JTAG} = 0\times0 - \text{Parallel six-wire JTAG is enabled and is mapped to a collection of module pins that must be enabled by programming their MUXSEL bits in the pin control block.} \\
\text{HW\_DIGCTL\_CTRL\_USE\_SERIAL\_JTAG} = 0\times1 - \text{Serial JTAG is enabled and uses the dedicated DEBUG pin. The ROM bootcode writes this field prior to enabling JTAG, selecting which type of JTAG pin signaling to use.} \\
\text{OLD\_JTAG} = 0\times0 - \text{Use six-wire parallel JTAG mode.} \\
\text{SERIAL\_JTAG} = 0\times1 - \text{Use one-wire serial JTAG mode.}
\]

#### Classic JTAG (multiplexed with SD card)

It is good idea to check the datasheet of the iMX233 processor for all the options in the digital...
control block. The processor's datasheet should be always the first piece of paper you consult when dealing with electronics.

Notice that the pad numeration is written at the bottom of OLinuXino-MINI under the microSD card connector. Please check the manual part for microSD card for a schematic of the pins.

6.2 SD/MMC slot

The microSD card slot is a standard 8pin connector.

We have tested a number of microSD cards on the OLinuXino boards and all of them worked fine regardless of manufacturer or capacity. However, keep in mind that some of the lower quality microSD cards might draw too much current from the slot which might cause power-state problems. If you suspect the microSD card is causing problems please try using another one of better quality for better results.

<table>

Notice that the pad numeration is written at the bottom of OLinuXino-MINI under the microSD card connector.

When removing the card, please make sure that you release it from the connector by pushing and NOT by pulling the card directly (this can damage both the connector and the microSD card).
6.3 UEXT module

OLinuXino board has UEXT connector and can interface Olimex's UEXT modules. For more information on UEXT please visit:

https://www.olimex.com/Products/Modules/UEXT/

*Note the two jumpers PIN29/SOFT_CL – PIN22/LCD_EN/I2C_SCL, and PIN28/SOFT_SDA3 – PIN21/LCD_HSYNC/I2C_SDA which by default are set to a software SPI. They can be used to set the whole UEXT to a hardware SPI.

The UEXT pinout is also printed at the bottom of the board under the connector.
6.4 GPIO (General Purpose Input/Output) 40pin connector

The GPIO pins are led out on a separate 40pin connector. They allow the user to attach additional hardware, check readings or perform hardware debug. The “GPIO Pin#” column shows connector number and does NOT represent the naming on the bottom of the board.

<table>

The hardware is associated differently in the Linux following the GPIO naming conventions.
suggested in the iMX233 datasheet. You can check the connection between Linux naming of the pin, Olimex naming of the pin and the consecutive connector pin number in the table below. The ones filled with “Not implemented” doesn’t have Linux support by the time of writing and will be updated overtime. “Linux GPIO” is the one you should use in Linux (the one in the datasheet); “OLinuXino name” is the pin as written on the bottom of the board. “OLinuXino GPIO Connector #” is the consecutive number of pins with BAT being Pin#1 and GND#40.

Note that if “OLinuXino Name” starts with P and then is followed by a number X, the PX is the name written on the bottom of the board (under the connector) with white ink. If “OLinuXino Name” is other text it is a signal used for the hardware of the board but still can be controller by the Linux (it can't be found at the GPIO connector though).

</tbody>
</table>

The above picture was made by a customer.
Below you can find the GPIO_CON as seen in the schematic:

When looking at the bottom of OLinuXino-MINI near the GPIO connector there is also an additional GND pad named GND_PIN which is a fast way to have access to a ground signal.
6.5 USB HOSTs

The USB hosts (and wireless connectivity option) are controlled by a single chip (GL850G).

The big advantage of having USB hosts available over USB devices is that you can as well use them as masters.

The signals follow the familiar and standard USB host pattern:

<table>
<thead>
<tr>
<th>PIN#</th>
<th>SIGNAL_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>USB_PWR_A</td>
</tr>
<tr>
<td>2</td>
<td>USB_HOST_D-</td>
</tr>
<tr>
<td>3</td>
<td>USB_HOST_D+</td>
</tr>
<tr>
<td>4</td>
<td>GND</td>
</tr>
</tbody>
</table>

6.6 PWR Jack

Our boards usually use a DC barrel jack with a 2.0mm thick inner pin. The outer hole diameter is 6.3mm. The standard power supply jack used in most of the OLIMEX boards has positive voltage in the inner pin. You should provide between 6 and 16 volts @ 1A to the board.

<table>
<thead>
<tr>
<th>Pin #</th>
<th>Signal Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Power Input</td>
</tr>
<tr>
<td>2</td>
<td>GND</td>
</tr>
</tbody>
</table>

More info about the power supply can be found in chapter 5 of this manual.
6.7 Headphones and line-in connector

Standard audio jack and phone jack are mounted for the audio interfacing.

<table>
<thead>
<tr>
<th>Headphones/Audio out connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin#</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>5</td>
</tr>
</tbody>
</table>

The headphones resistance is 16 Ohms!

<table>
<thead>
<tr>
<th>Line in/Audio in connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin#</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>5</td>
</tr>
</tbody>
</table>
6.8 Battery connector

When using the battery connector keep in mind that it is an energy solution that wouldn't be able to power the board and all the peripherals. The voltage of a 3.7V LIPO battery would be enough to power the processor and the memory but probably won't be enough to power all the devices you mount on the USB hosts.

<table>
<thead>
<tr>
<th>Pin #</th>
<th>Signal Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>VBAT</td>
</tr>
<tr>
<td>2</td>
<td>GND</td>
</tr>
</tbody>
</table>

The pins are also written on the top of the board in the base of the connector.

6.9 Composite video connector

The composite video is the connector you should use if you wish OLinuXino-MINI video output on a monitor.

The whole signal is controlled by pin #104 from the i.MX233 processor.

The + signal is lead to the middle of the connector. The outside part is the GND.
6.10 Boot mode positions

The iMX233 can boot the operating system from different locations. The default location for the Linux files we used is the microSD card. There are 4 (four) jumpers responsible for the boot location: D03, D02, D01 and D00. They are located on the top of the board between the processor and 40pin GPIO connector. Note that the jumpers are SMD type and opening a jumper would require cutting, closing a jumper would require soldering. To be able to do the quoted operations you will need basic engineering skills and experience. You can check below the table or the schematic for the correct positions. Value of “1” means the jumper is closed.

<table>

</tbody>
</table>
6.11 Jumper description

Please note that all the jumpers on the board are SMD type. If you feel insecure in your soldering/cutting technique it is better not to try to adjust the jumpers.

6.11.1 SCL_SW/SCL_HW and SDA_SW/SDA_HW

Those two jumpers must be moved together – there are two available options – configuring software I2C interface (SCL_SW, SDA_SW) or hardware I2C interface (SCL_HW, SDA_HW positions).

The default position is SCL_HW/SDA_HW (hardware SCL).

6.11.2 5V_E

The 5V_E jumper allows control over the powering line. If you want to disable the 5V powering line open 5V_E jumper.

The default position is closed.

6.11.3 3.3VIO_E and 3.3V_E jumpers

Important these jumpers must be moved together! Closing both of 3.3V_E and 3.3VIO_E at the same time will damage the processor. One of them has to be open (unsoldered)

Important these jumpers must be moved together! Closing both of 3.3V_E and 3.3VIO_E at the same time will damage the processor. One of them has to be open (unsoldered/cut). There are two possible positions:

1) 3.3V_E closed (soldered), 3.3VIO_E open (unsoldered/cut)
2) 3.3V_E open (unsoldered/cut), 3.3VIO_E closed (soldered)

In the default variant 1) the board uses the mounted by OLIMEX DC-DC 3.3V convertor which when the board is powered by external supply is the better alternative. However, if you use battery it will not power the chip handling the USB and the LAN functionality. Basically the board will lack USB-HOSTs and LAN when jumpers are set in variant 1) and the board is powered by a battery via the BAT connector.

If you set the jumpers in 2) state the board's 3.3V will be handled by the built-in iMX233 DC-DC but the problem is it isn't configured to be used with another chip so it doesn't provide enough current for all the USB-HOSTs and the LAN which might cause some of the devices plugged in the USB to lack power and also might burn the chip if too much current is drawn. However, in this 2) mode of jumpers it is possible to power the board from a battery and still have some current on the USB-HOSTs and the LAN. The maximum current the built-in DC-DC can provide safely is 200mA.

6.11.4 Boot mode selecting jumpers

The boot mode is discussed in chapter 6.11 of this manual.
6.12 Additional hardware components

The components below are mounted on OLinuXino but are not discussed above. They are listed here for completeness:

**Reset button** – used to reset the board

**Power button** – when Linux is running pressing PWR_BUT will put the board in low power mode; when powered by battery PWR_BUT is used to initially power up the board – and pressing the board again after it is powered will put it low power mode

**Recovery pads (REC)** - these can be used for attaching a recovery button; when powered by battery the recovery button is used to bring the processor to normal power mode – you can short-circuit the pads for this feature without having to mount a button

**512 (32M x 16) MBit DDR SDRAM** – the exact memory used at the moment of writing is Xilinx H5DU5xxxxyy

**LED1 + Power LED**

6.13 Accessories

Here you will find additional information for Olimex products that you can use with OlinuXino-MINI.

6.13.1 USB-SERIAL-CABLE-F

The cable for the U_DEBUG interface that can be purchased for additional cost has three cables. It is important to specify in your purchase order whether you want the USB-SERIAL-CABLE-F variant with male of female connectors.

You will need a drivers that can be downloaded from the page of USB-SERIAL-CABLE: [https://www.olimex.com/Products/Components/Cables/USB-Serial-Cable/USB-Serial-Cable-F/](https://www.olimex.com/Products/Components/Cables/USB-Serial-Cable/USB-Serial-Cable-F/)
CHAPTER 7 BLOCK DIAGRAM AND MEMORY

7. Introduction to the chapter

On the next page you can find a memory map for this family of processors. It is strongly recommended to refer to the original datasheet released by Freescale for one of higher quality.

7.1 Memory addresses

Below is the table with some of the most frequently used addresses. For full list of addresses check the manual released by Freescale (Chapter Memory Map).

<table>

CHAPTER 8 SCHEMATICS

8. Introduction to the chapter

In this chapter are located the schematics describing logically and physically OLinuXino.

8.1 Eagle schematic

OLinuXino schematic is visible for reference here. You can also find them on GitHub page for OLinuXino at our site: https://www.olimex.com/Products/OLinuXino/iMX233/iMX233-OLinuXino-MINI/. The link to the GitHub is located in HARDWARE section.

The EAGLE schematic is situated on the next page for quicker reference.
8.2 Physical dimensions

Note that all dimensions are in inches.

The three highest elements on the board in order from the tallest to the shortest are: capacitor C68 – 16.2mm (0.640") over the pcb; USB host connectors – 13.6mm (0.525"); composite connector – 12.0mm(0.464").
CHAPTER 9 REVISION HISTORY AND SUPPORT

9. Introduction to the chapter

In this chapter you will find the current and the previous version of the document you are reading. Also the web-page for your device is listed. Be sure to check it after a purchase for the latest available updates and examples.

## 9.2 Board revision

<table>
<thead>
<tr>
<th>Revision</th>
<th>Notable Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>- Initial release of the board</td>
</tr>
<tr>
<td></td>
<td>- R31 to R38 are changed to NA, because into the newest GL850G datasheet(schematic) they are removed</td>
</tr>
<tr>
<td></td>
<td>- In addition PSELF is connected to V33 pin through 10k resistor with the aim of GL850G to be set in self-powered mode</td>
</tr>
<tr>
<td></td>
<td>- Altered inductors: L1, L2 and L5 to 7x8mm package.</td>
</tr>
<tr>
<td></td>
<td>- All capacitors 22uF/0805 are now changed to 22uF/0603</td>
</tr>
<tr>
<td></td>
<td>- Added prints of the names of WIFI and PGM_FUSES connectors</td>
</tr>
<tr>
<td></td>
<td>- New powering scheme with jumpers for the WIFI</td>
</tr>
<tr>
<td></td>
<td>- Removed FET1 due to resistance and because TVS works also as a protection</td>
</tr>
<tr>
<td></td>
<td>- PWR_LED and LED1 were too bright, the resistor is now 2.2k</td>
</tr>
<tr>
<td>D</td>
<td>- WIFI connector has been moved with 1mm near the quartz so it is far enough from the capacitors</td>
</tr>
<tr>
<td></td>
<td>- Added 100k pull-down resistor on the debug line. According to the IMX23RM, page 1368: If the DEBUG pin is unused, Freescale recommends pulling the DEBUG pin to ground through a 100K resistor.</td>
</tr>
<tr>
<td></td>
<td>- Changed the text DEBUD to DEBUG into the SJTAG's connector bottom silk.</td>
</tr>
<tr>
<td></td>
<td>- Added Schottky diode and increased R9 to 4.7K because of bug that might appear if using</td>
</tr>
<tr>
<td></td>
<td>- Added C75(10pF)</td>
</tr>
<tr>
<td></td>
<td>- Added ferrite bead 2A on the 4th USB of the hub also (wifi only)</td>
</tr>
<tr>
<td>E</td>
<td>- Moved the print of the names of PWR_JACK and 6-16VDC since they were overlapping; The Composite Video print is also adjusted. LINE_IN and HEADPHONES are also moved a bit. R44 and R55 too.</td>
</tr>
<tr>
<td></td>
<td>- The jumpers SW_SCL/HW_SCL and SW_SDA/HW_SDA position is changed to default HW (hardware SCL)</td>
</tr>
<tr>
<td></td>
<td>- PGM_FUSES line is changed 10mils to the upper side, C48 is moved 5mils to the bottom edge.</td>
</tr>
</tbody>
</table>
9.3 Useful web links and purchase codes

The web page you can visit for more info on your device is https://www.olimex.com/Products/OLinuXino/iMX233/iMX233-OLinuXino-MINI/, https://www.olimex.com/wiki/IMX233

You can get the latest updates on the software at: https://github.com/OLIMEX/OLINUXINO. The OLinuXino Linux images sources: https://github.com/Freescale/fsl-community-bsp-platform.

ORDER CODES:

iMX233-OLinuXino-MAXI – the best version of OLinuXino featuring Ethernet controller
iMX233-OLinuXino-MINI – the mini version of the single-board computer
iMX233-OLinuXino-MICRO – tiny in size, tiny in price and perfect for breadbording

iMX233-OLinuXino-MINI-WIFI – the MINI version of OLinuXino + embedded RTL8128CU WIFI module

iMX233-OLinuXino-SD – SD card with the Linux image which can be used with every board from the OLinuXino family
MOD-WIFI_RTL8188 – external USB WIFI modem with RTL8188 chip
USB-SERIAL-CABLE—USB serial console cable for U_DEBUG
SY0612E – power supply adapter 12V/0.5A for iMX233-OLinuXino-MAXI and iMX233-OLinuXino-MINI (Will not work with OLinuXino-MICRO)
SY0605E – power supply adapter 5V/1A for iMX233-OLinuXino-MICRO (Will not work with iMX233-OLinuXino-MAXI and iMX233-OLinuXino-MINI)

The latest price list can be found at https://www.olimex.com/prices.

How to order?

You can order directly from our web shop or from any of our distributors.

The full list of distributors can be found here: https://www.olimex.com/Distributors/.

Visit https://www.olimex.com/ for more info.
9.4 Product support

For product support, hardware information and error reports mail to: support@olimex.com. All document or hardware feedback is welcome. Note that we are primarily a hardware company and our software support is limited. Please consider reading the paragraph below about the warranty of Olimex products.

All goods are checked before they are sent out. In the unlikely event that goods are faulty, they must be returned, to OLIMEX at the address listed on your order invoice.

OLIMEX will not accept goods that have clearly been used more than the amount needed to evaluate their functionality.

If the goods are found to be in working condition, and the lack of functionality is a result of lack of knowledge on the customers part, no refund will be made, but the goods will be returned to the user at their expense.

All returns must be authorized by an RMA Number. Email support@olimex.com for authorization number before shipping back any merchandise. Please include your name, phone number and order number in your email request.

Returns for any unaffected development board, programmer, tools, and cables permitted within 7 days from the date of receipt of merchandise. After such time, all sales are considered final.

Returns of incorrect ordered items are allowed subject to a 10% restocking fee. What is unaffected? If you hooked it to power, you affected it. To be clear, this includes items that have been soldered to, or have had their firmware changed. Because of the nature of the products we deal with (prototyping electronic tools) we cannot allow returns of items that have been programmed, powered up, or otherwise changed post shipment from our warehouse.

All returned merchandise must be in its original mint and clean condition. Returns on damaged, scratched, programmed, burnt, or otherwise 'played with' merchandise will not be accepted.

All returns must include all the factory accessories which come with the item. This includes any In-Circuit-Serial-Programming cables, anti-static packing, boxes, etc.

With your return, enclose your PO#. Also include a brief letter of explanation of why the merchandise is being returned and state your request for either a refund or an exchange. Include the authorization number on this letter, and on the outside of the shipping box.

Please note: It is your responsibility to ensure that returned goods reach us. Please use a reliable form of shipping. If we do not receive your package we will not be held liable.

Shipping and handling charges are not refundable. We are not responsible for any shipping charges of merchandise being returned to us or returning working items to you.

The full text might be found at https://www.olimex.com/wiki/GTC#Warranty for future reference.
